

## The Database

contact Columns			
Entry	name (Primary Key)	address	phone
row 1	Dakota Cromer	123 madeup drive	404-555-5555
row 2	George P. Burdell	North Ave NW	770-555-5561

## [Index.html](#)

This is a quick and dirty form that I built to handle taking in data from the user, and executing javascript code.

## Execute.js

Execute.js is the javascript function holder for the form. From here I send jquery ajax requests based on which radio button the user has selected in the form. I attempted to use ajax as a means of hardening the code against SQL injection.

## Configure.php

Configure.php is used to hold all of the connection info for the database.

## Handle.php

Handle.php is where the bulk of the CRUD operations happen. I first decode the ajax request, then I store the relevant data into variables, and use prebuilt SQL queries but add the relevant variables as part of the string and then execute to the database.
